

THANK YOU FOR PARTICIPATING IN THE TULANE ANTIBODY STUDY!

- A: In most unvaccinated participants, COVID-19 infection resulted in the production of neutralizing antibodies, which protect you from infection when you are exposed to a virus.
- About 20% of people with COVID-19 infection did not develop antibodies to any part of the virus (spike or nucleoprotein, which are different regions of the virus)
- B: Pfizer or Moderna vaccination resulted in high levels of antibodies within 90 days of vaccination, though these declined rapidly after 6 months
- Younger people (ages 1-17) were less likely to report symptoms after infection and developed lower levels of antibodies

MARCH 2022 NEWSLETTER

None of this would be possible without each of you! We will be sending out newsletters to update you on our ongoing studies and results. We encourage you to continue to participate in follow up appointments, as each sample gives us the opportunity to track immunity changes over time. Thank you!
